Adverse Reactions To Non Steroidal Anti Inflammatory Drugs
Clinical Pharmacoepidemiology Advances In Pharmacological
Adverse reactions to non steroidal anti-inflammatory drugs (NSAIDs) are a significant concern in clinical practice. NSAIDs, including aspirin, are widely used for pain relief, inflammation, and fever reduction. Aspirin, the only NSAID able to irreversibly inhibit cyclooxygenase-1 (COX-1), is also indicated for antithrombotic purposes through inhibition of platelet aggregation. This is particularly useful for the management of arterial thrombosis and prevention of adverse cardiovascular events like heart attacks.

5.8 Risk of Serious Adverse Reactions in Infants due to Benzyl Alcohol Preservative * Lovenox

Abdominal Surgery * Lovenox † ‡ § †
